

PROJECT TITLE

Organic Grocery Store Management System

1. Introduction – Purpose

The Organic Grocery Store Management System is a database-driven application developed to manage the daily operations of an organic grocery business. The purpose of this system is to maintain accurate records of customers, products, orders, suppliers, inventory, and payments in a centralized database. It enables customers to purchase organic products online while helping the store owner efficiently manage stock, process orders, and generate reports. The system reduces manual work, improves data accuracy, and provides a smooth shopping experience.

2. Functions / Operations on the Data for this Application

Customer Management

- Register new customers.
- Store and update customer details.
- Manage customer login and profile information.
- View customer purchase history.

Product Management

- Add new organic grocery products.
- Update product details such as price, quantity, and category.
- Delete discontinued products.
- Search and display available products.

Supplier Management

- Store supplier information.
- Add, update, or remove supplier records.
- Maintain records of products supplied by each supplier.

Inventory Management

- Monitor stock availability.

- Automatically update stock after every purchase.
- Display low-stock alerts.
- Record newly arrived stock.

Order Management

- Create new customer orders.
- Update order status (Pending, Packed, Shipped, Delivered).
- Cancel or modify orders.
- Maintain complete order history.

Payment Management

- Record online and offline payments.
- Verify payment status.
- Generate payment receipts.
- Store transaction details securely.

Delivery Management

- Assign delivery personnel.
- Update delivery status.
- Track completed and pending deliveries.

Report Generation

- Generate sales reports.
- Generate inventory reports.
- View customer order reports.
- Display monthly and yearly business summaries.

Conclusion

The Organic Grocery Store Management System provides an efficient way to manage business data using a DBMS. It ensures proper storage, retrieval, updating, and maintenance of information related to customers, products, orders, inventory, suppliers, and payments. The system improves business efficiency, reduces errors, and supports better decision-making through accurate data management.
